A. TITLE–SOP ALIGNMENT

- "Your title implies a relationship between allowance-based decision making and daily purchasing choices, yet your Statement of the Problem treats them as separate outcome variables."
- "There is currently no research question that directly examines the relationship between allowance-based decision making and purchasing choices, even though the title implies this connection."

B. JUSTIFICATION OF IMPORTANCE OF THE STUDY (Not mentioned in your research intro)

"Why is comparing ABM and STEM students meaningful?"

- **Highlight the problem in your intro to justify:**

  ABM students are exposed to finance-related concepts, which may shape allowance-based decision making differently than STEM students.

The introduction cited studies showing that most research focuses only on **financial literacy or spending behavior separately**, without looking at **how allowance management directly relates to spending choices**. (MAIN OBJECTIVE BASED ON YOUR TITLE)

Highlight in your intro that examining the relationship allows the study to fill this **gap**, showing whether **better decision-making translates into more controlled or structured spending**.

Then, add the main objectives of your study at the end of your introduction.

C. MISSING SOP QUESTION TO EXAMINE RELATIONSHIP

Based on your objectives

*: **examining the relationship** between allowance-based decision making and purchasing choices, and comparing ABM and STEM students*

Which specific research question directly addresses the gap? (Missing)

Suggestion: Add in your SOP

6. Is there a significant relationship between students' allowance-based decision making and their daily purchasing choices?

D. SOP 3 CLARIFICATION (Purchasing Choices)

- *"For SOP 3, kindly clarify how daily purchasing choices are measured."*

Are you measuring:

- Frequency of purchase?
- Amount spent? (recommended)
- Preference or priority?

Suggested revision for sop 3: How much do students spend daily on the following purchasing choices:

E. REVISE SOP 4 and 5

Focus on the main objective which is **to compare ABM and STEM** based on their allowance-based decision making and purchasing choices.

REVISED STATEMENT OF THE PROBLEM

This study aims to examine the **relationship between allowance-based decision making and daily purchasing choices**, and to determine whether these variables differ between **Grade 12 ABM and STEM students** of Bagumbayan National High School.

Specifically, it seeks to answer the following questions:
1. What is the demographic profile of the respondents in terms of:
   1.1 Academic Strand (ABM or STEM)
   1.2 Daily Allowance

2. What is the level of students' allowance-based decision making in terms of:

2.1 spending habits
2.2 budget management
2.3 saving habits
2.4 financial awareness

3. How much do students spend daily on the following purchasing choices:

3.1 food
3.2 transportation
3.3 school supplies
3.4 wants

4. Is there a significant difference in allowance-based decision making between ABM and STEM students?
5. Is there a significant difference in daily purchasing choices between ABM and STEM students?
6. Is there a significant relationship between students' allowance-based decision making and their daily purchasing choices?

SAMPLE INSTRUMENT:

SECTION 1: Demographic Profile

Academic Strand: ☐ ABM ☐ STEM

Average Daily Allowance:

☐ Below ₱50
☐ ₱51–₱100
☐ ₱101–₱150
☐ ₱151–₱200
☐ Above ₱200

SECTION 2: Allowance-Based Decision Making

(Likert-scale since this is about habits and awareness. 3-5 QUESTIONS PER INDICATOR)

SECTION 3: Daily Spending Amounts

Instructions: Write the average amount in pesos (₱) you usually spend daily for each item. If you do not spend on an item, write 0.

Category	**Average Amount in Pesos (₱)**
3.1 Food	_____
3.2 Transportation	_____
3.3 School supplies	_____
3.4 Wants	_____

Suggested DATA ANALYSIS FOR EACH SOP:

SOP 1 : Frequency and percentage
SOP 2: Weighted mean
SOP 3: Mean
SOP 4: Independent-samples **t-test** → compare allowance-based decision making between ABM vs STEM
SOP 5: Separate Independent-samples **t-test** → compare ABM vs STEM for total spending
SOP 6: Pearson correlation or Spearman if non-normal

HOW TO DO sop 6:

1. get the **total allowance based decision-making score** per respondent

Allowance Based Decision-Making Score = $\frac{Sum\ of\ all\ items}{number\ of\ items}$

2. Each respondent reports **exact pesos (₱)** spent in:

3.1 Food
3.2 Transportation
3.3 School Supplies
3.4 Wants

3. Compute **Pearson correlation** (or Spearman if non-normal) between:

X (Decision Score)	Y (Category Spending)
Weighted Mean of Section 2	Food ₱
Weighted Mean of Section 2	Transportation ₱
Weighted Mean of Section 2	School Supplies ₱
Weighted Mean of Section 2	Wants ₱
